# iMediaLogger Player Audio Scrubbing

iMediaLogger Player is an application that communicates with Logger 6 for audio and the Web Portal for AsRun information. This player provides waveform viewing, monitoring and exporting of Logger recorded audio. You must have Logger 6 installed prior to installing the iMediaLogger Player. Some of the key features of this Player application:
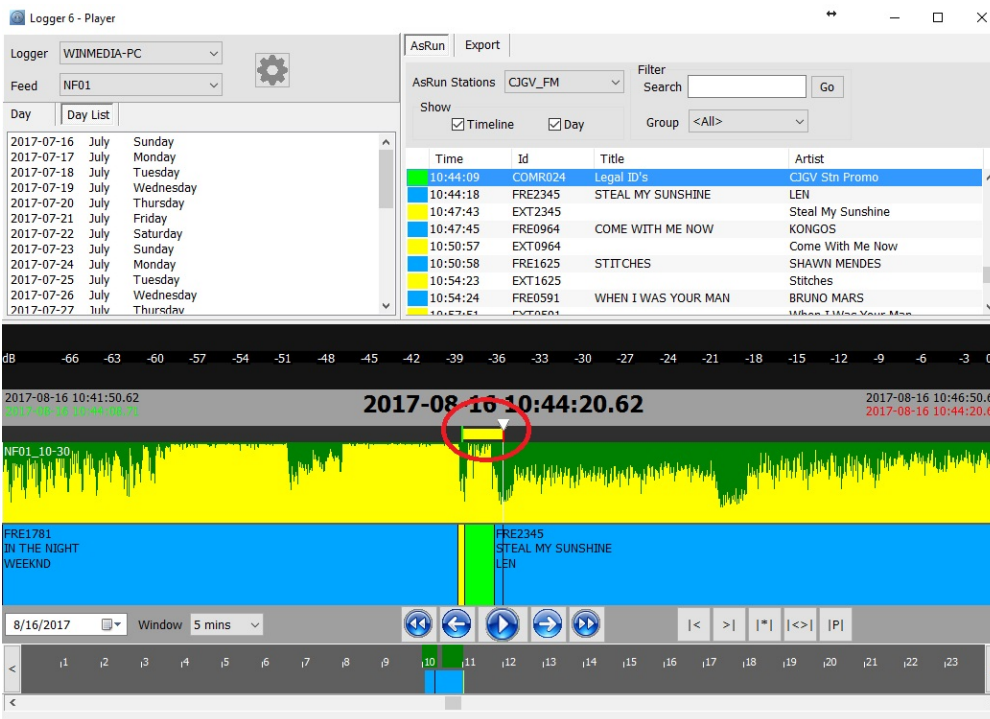

- Daily, Hourly, Minute display with timelines
- Waveform display on recoded audio
- Displays As Run content when using the OMT suite (OnAir and Web Portal) for traffic/client spot validation
- Group filter to display specific AsRun content
- Convenient Search engine based on title/Artist field
- Audio Scroll feature
- Export feature with sorting and multi cut grouping capability

iMediaLogger Player allows the user to quickly and effectively do spot 'scrubbing' of audio to quickly access audio clips in the use of compiling 'Best of' shows, CRTC/FCC compliance, and podcasting

As noted in the above picture, using a left click on the black bar above the waveform you can denote a starting hash point for the file export.

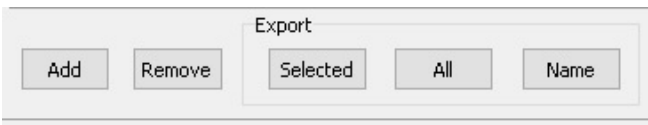

While previewing the audio, you can then right click on the same bar to denote the 'end' hash for the audio you wish to export.
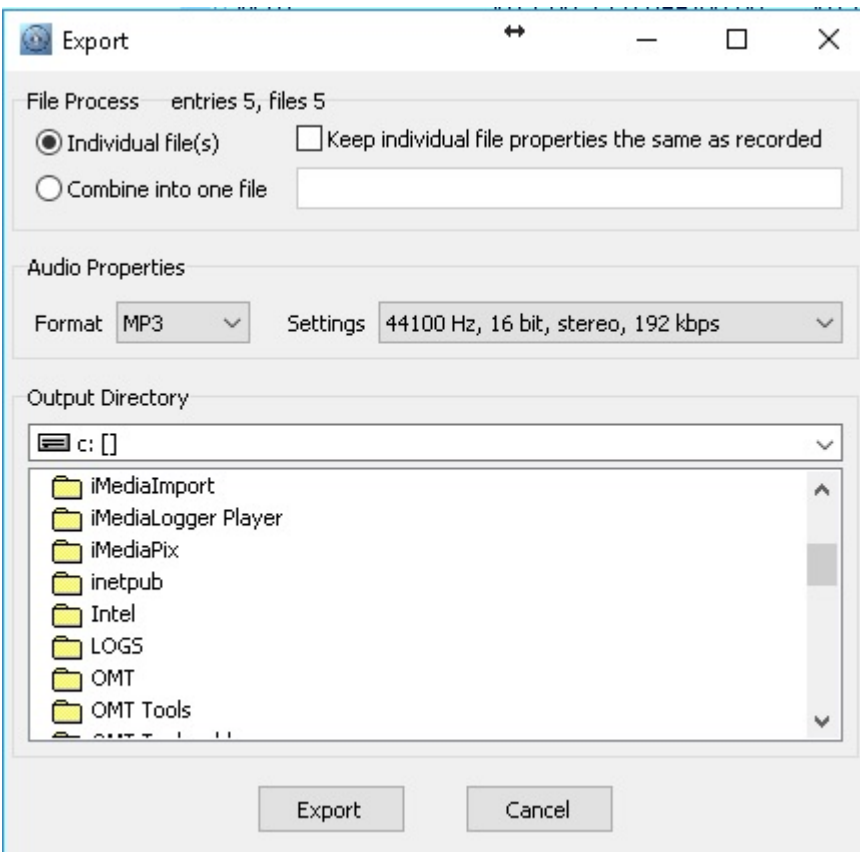

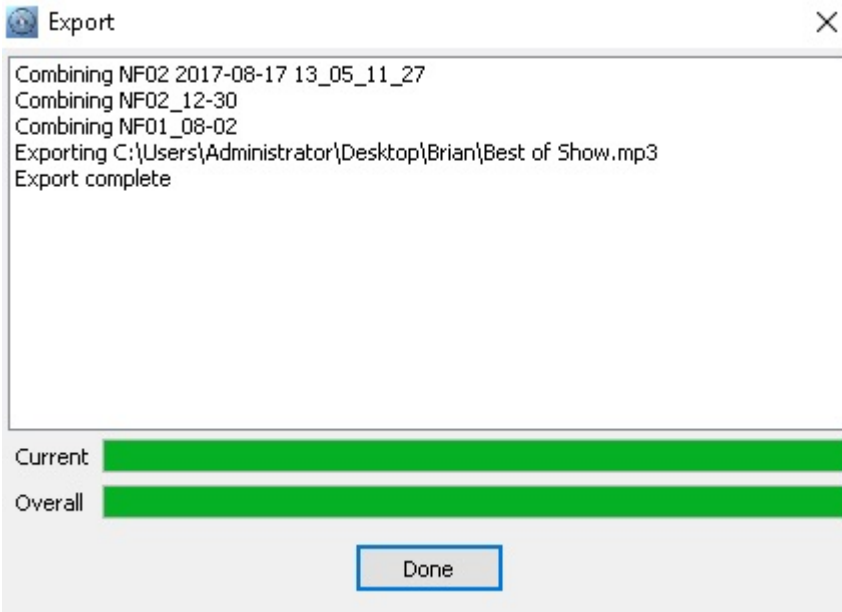

Next click on the 'Export' tab and click on the 'Add'(b) button, this will add the selected portion of audio to your export list. You can continue to do this as you continue to add additional audio clips to your export audio list.

Finally click on either 'Selected' if you only wish to export selected audio clips or 'All' to select all audio to export.

Give it a unique file name and select whether you wish to export the file as either an .mp3 or .wav (pcm) file.

Export
