

iMediaTransfer

Example of a TOC or Source provider with two Affiliates

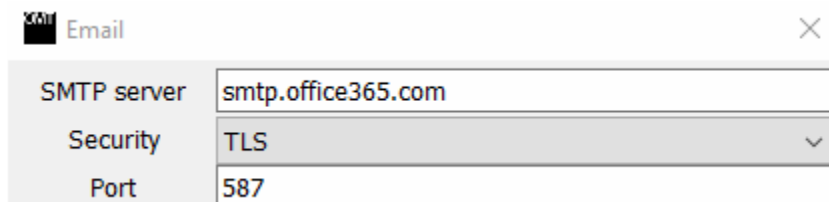

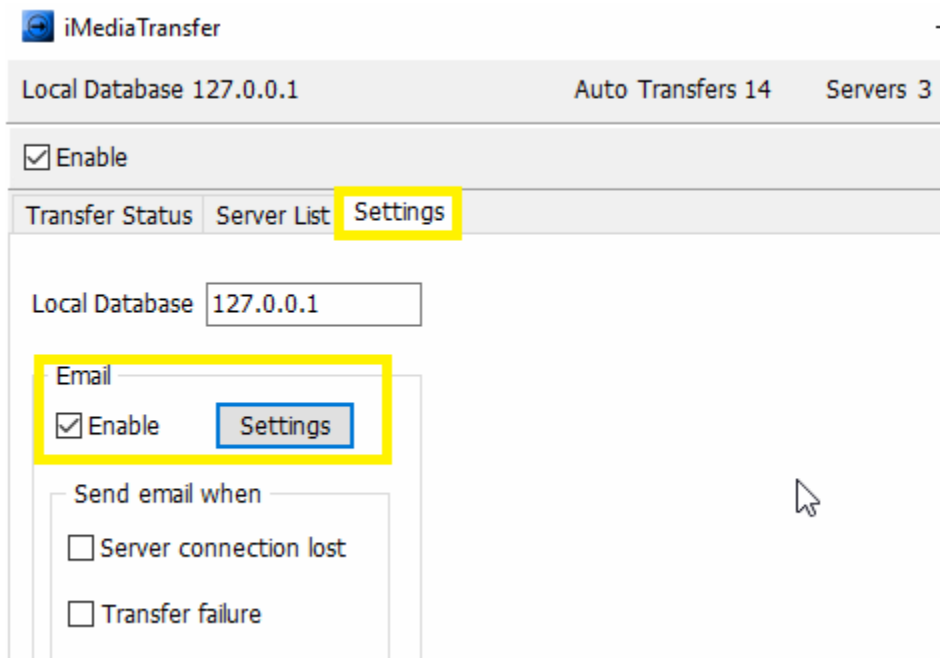

In the above diagram, Voice Track Merge logs are generated at the source which will merge the music log into an .INT log. The .INT log is sent out to 2 Affiliates that will use Automerge to combine the .INT with the traffic file once it is available.

.INT logs allow talent to voice track music logs sometimes weeks in advance that can be later merged with traffic logs once they are available. This provides the most flexibility for both talent and traffic in terms of when they have to have either the music or traffic log available for merge.

The combination of iMediaTransfer and Automerge either on the source server or local to each OnAir in the Affiliate mode automates the entire process so that PD's and traffic members only need to post the music and traffic logs to automation.

If there is an error, it can be detected by new email and messaging features within iMediaTransfer in addition to manual log file validation.

Copy

The copy feature makes a duplicate of the scheduled item you have highlighted and opens into the Auto Schedule edit window. Where you are using the same profile but sending to a different location, you can simply change that location without having to re-enter all of the other information over again. This is particularly useful where you have numerous locations receiving the same audio or log content.
